

CURRICULUM PLAN PE GCSE practical and theory

P2-22. Skeletal system – functions applied to performance in physical activities and sports - Protection of vital organs, muscle attachment, joints for movement, platelets, red and white blood cell production, storage of calcium and phosphorus. Classification of bone type is relevant to performance in physical activities and sports. Structure of the skeletal system – bone names. Role of ligaments/tendons in physical activity. Movements at joints/classification of joints (pivot, hinge, ball and socket, codyloid). Muscular system – classification of muscles and their roles when participating in physical activity and sport. Cardiovascular system – functions (transport, blood clotting, temperature control) applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of arteries, capillaries and veins and how this relates to function and importance during physical activity and sport in terms of: blood pressure; oxygenated / deoxygenated Vascular shunting / (vasoconstriction, vasodilation) and then resting blood and changes due to physical activity, carbohydrates source for aerobic and anaerobic activity, carbohydrates source for aerobic and sport on this relates to function and importance during physical activities compared to when resting blood and changes due to physical with the production dioxide and water, the impact oxygen on energy release, the anaerobic respiration (lactic aci exercise. Participant in physical activity and sport (red and white blood cells, plasma, platelets.) Respiratory system – composition of air, lung volumes and changes due to physical activity. Location of main components and the role in movement of oxygen and carbon dioxide into and importance during physical activity. Location of main components and the role in movement of oxygen and carbon dioxide into and importance during physical activity and sport in terms of: blood pressure; oxygenated vascular structure of arteries, capillaries and veins a	YEAR	TRINITY 2	MICHAELMAS 1	MICHAELMAS 2	
1.1 Skeletal System & muscular system P2-22. Skeletal system – functions applied to performance in physical activities and sports- Protection of vital organs, muscle attachment, joints for movement, platelets, red and white blood cell production, storage of calcium and phosphorus. Classification of bones and how function of bone type is relevant to performance in physical activities and sports. Structure of the skeletal system – bone names. Role of ligaments/tendons in physical activity. Movements at joints/classification of joints (pivot, hinge, ball and socket, codyloid). Muscular system – classification of muscles and their roles when participating in physical activity and sport. Characteristics of muscle types and location (cardiac, voluntary, involuntary). Antagonistic pairs – biceps/triceps, harden and sports. 1.2 Cardiovascular ysystem p22-35. Cardiovascular system – functions (transport, blood clotting, temperature control) applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance during physical activity and sport in terms of: blood for redistribution of blood flow (vascular system) physical activity and sport in terms of: blood for redistribution of blood flow (vascular system) physical activity, and sport (red and white blood clotting, temperature control) applied to performance in physical activity and sport in terms of: blood for redistribution of blood flow (vascular system) physical activity, and sport (red and white blood clotting, tem	_				
Skeletal system – functions applied to performance in physical activities and sports - Protection of vital organs, muscle attachment, joints for movement, platelets, red and white blood cell production, storage of calcium and phosphorus. Classification of bones and how function of bone type is relevant to performance in physical activities and sports. Structure of the skeletal system – bone names. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of arteries, capillaries and veins and how this relates to function and importance during physical activity and sport in terms of: blood pressure; oxygenated; deoxygenated Vascular systems. Function of blood flow (vascular systems of physical activity and sport (red and white blood cells, plasma, platelets.) Respiratory system – composition of air, lung volumes and changes due to physical activity. Cardio or deal reversions. Functions of blood flow (vascular systems of blood flow (vascular systems) and the restarcion of plood flow (vascular systems) and changes due to physical activity and sport (red and white blood cells, plasma,		P2-22.			
Muscular system – classification of muscles and their roles when participating in physical activity and sport. Characteristics of muscle types and location (cardiac, voluntary, involuntary). Antagonistic pairs – biceps/triceps, hamstrings/guadriceps. Muscular system – classification of muscles for physical activity and sport (red and white blood for physical activity and sport (red and white blood cells, plasma, platelets.) Respiratory system – composition of air, lung volumes and changes due to physical activity. Location of main components and the role in movement of oxygen and carbon dioxide into and output to the composition of air, lung volumes and changes due to physical activity. CV: heart rate, stroke volume and output to place the composition of air, lung volumes and changes due to physical activity.		performance in physical activities and sports - Protection of vital organs, muscle attachment, joints for movement, platelets, red and white blood cell production, storage of calcium and phosphorus. Classification of bones and how function of bone type is relevant to performance in physical activities and sports. Structure of the skeletal system – bone names. Role of ligaments/tendons in physical activity. Movements at joints/classification of joints	blood clotting, temperature control) applied to performance in physical activities. Structure of the cardiovascular system applied to performance in physical activities. Structure of arteries, capillaries and veins and how this relates to function and importance during physical activity and sport in terms of: blood pressure; oxygenated; deoxygenated Vascular shunting -(vasoconstriction, vasodilation) and the need for redistribution of blood flow (vascular shunting) during physical activities compared to	Use of data. P40-49. 2.1 Lever systems. P51-55 Energy sources - Fats as a fuel source for aerobic activity, carbohydrates as a fuel source for aerobic and anaerobic activity. The use of glucose and oxygen to release energy aerobically with the production of carbon dioxide and water, the impact of insufficient oxygen on energy release, the by-product of	
gastrocnemius/anterior tibialis, hip flexors/gluteals. Fast and slow twitch muscle fibres and how fibre type impacts on their use in physical activities. Fast and slow twitch muscle fibres and how fibre type impacts on their use in physical activities. Structure and function of the alveoli and the impact of varying intensities of exercise (aerobic/anaerobic). Respiratory: on depth and rate despiratory: on depth and rate impact of varying intensities of exercise (aerobic/anaerobic).		Muscular system – classification of muscles and their roles when participating in physical activity and sport. Characteristics of muscle types and location (cardiac, voluntary, involuntary). Antagonistic pairs – biceps/triceps, hamstrings/quadriceps, gastrocnemius/anterior tibialis, hip flexors/gluteals. Fast and slow twitch muscle fibres and how fibre type impacts on their use in physical	Function and importance of components of blood for physical activity and sport (red and white blood cells, plasma, platelets.) Respiratory system – composition of air, lung volumes and changes due to physical activity. Location of main components and the role in movement of oxygen and carbon dioxide into and out of the body. Structure and function of the alveoli and the impact of varying intensities of exercise	Short term and long term effects of exercise- Muscular: lactate accumulation, muscle fatigue CV: heart rate, stroke volume and cardiac output Respiratory: on depth and rate of breathing. Data questioning using graphs. Interpretation and analysis of graphical representation of data associated with trends in heart rate and	

activity and sport (1 st , 2 nd , 3 rd).
Mechanical advantage/disadvantage loads,
efforts and range of movement of the body's
lever systems and the impact on sporting
performance.

LENT 1	LENT 2	TRINITY 1
Component 1	Component 1	Component 1
2.2 Planes and axes of movement. P56-61	3.3 Principles of training and application to PEP & Method. P81-97.	3.5 How to optimise training and prevent injury p102-108.
3.1 Relationship and fitness & the roles that exercise plays in both. P63-65.	3.4 Long term effects of exercise.	Performance enhancing drugs p108-112.
	P98-101.	3.6 Warm up and cool down
Component 1		
3.2 Components of fitness, benefits for sport. Testing of fitness. P66-80. (Link with Practical)	Principles of training - Individual needs, specificity, progressive overload, FITT (frequency, intensity, time, type), overtraining, reversibility, thresholds of training (aerobic target zone: 60–80% and anaerobic target zone: 80%–90%, calculated using Karvonen formula).	Identifying injury, treatment and common sports injuries (Concussion, fractures, dislocation, sprain, torn cartilage and soft tissue injury (strain, tennis elbow, golfers elbow, abrasions) RICE (rest, ice, compression, elevation).
Planes and axes - Sagittal plane about the frontal axis when performing front and back tucked or piked somersaults. Frontal plane about the sagittal axis when performing cartwheels. Transverse plane about the vertical axis when performing a full twist jump in trampolining.	Methods of training - Continuous, Fartlek, circuit, interval, plyometrics, weight/resistance. Fitness classes for specific components of fitness, physical activity and sport (body pump, aerobics, pilates, yoga, spinning). The advantages and disadvantages of different training methods.	Injury prevention through: correct application of the principles of training to avoid overuse injuries; correct application and adherence to the rules of an activity during play/participation; use of appropriate protective clothing and equipment; checking of equipment and facilities before use, all as applied to a range of physical
Definitions of fitness, health, exercise and performance and the relationship between them Links between this topic and the PEP Components of fitness and the relative importance of these components in physical activity and sport. Theory: the value of fitness testing; the purpose of specific fitness tests; the selection of the appropriate	Factors to consider when deciding the most appropriate training methods and training intensities for different physical activities and sports (fitness/sport requirements, facilities available, current level of fitness) Long term effects of exercise - Benefits to the musculo-skeletal system: increased bone density; increased strength of ligaments and	activities and sports. Performance-enhancing drugs (PEDs) and their positive and negative effects on sporting performance and performer lifestyle, including: anabolic steroids; beta blockers; diuretics; narcotic analgesics; peptide hormones (erythropoietin (EPO); growth hormones (GH)); stimulants; blood doping. Advantages and disadvantages.

fitness test for components of fitness; and the There rationale for selection. Collection and interpretation of of rest for adaptations to take place; and time data from fitness test results. Analysis and evaluation of fitness test results against normative data tables.

tendons; muscle hypertrophy; the importance to recover before the next training session. Impact on performance in different types of activities.

Benefits to the cardio-respiratory system: decreased resting heart rate; faster recovery; increased resting stroke volume and maximum cardiac output; increased size/strength of heart; increased capilliarisation; increase in number of red blood cells; drop in resting blood pressure due to more elastic muscular wall of veins and arteries; increased lung capacity/volume and vital capacity; increased number of alveoli; increased strength of diaphragm; and external intercostal muscles.

The purpose and importance of warm-ups and cool downs to effective training sessions and physical activity and sport. Phases of a warm-up and their significance in preparation for physical activity and sport. Activities included in warm-ups and cool downs

YEAR	TRINITY 2	MICHAELMAS 1	MICHAELMAS 2
10			
	Component 2	Component 2	Component 2
core	1.1 Physical, emotional and social health, fitness and well-being.	1.2 Consequences of a sedentary lifestyle. P138-143.	2.1 Classification of skill. P154-155.
	P125-137. Physical, social and emotional well-being - how participation in physical activity and sport can improve social/psychological and physical health and how these benefits are achieved.	1.3 Energy use, diet, nutrition and hydration. P144-152. Lifestyle choices in relation to: diet; activity level; work/rest/sleep balance; and recreational drugs (alcohol, nicotine). Positive and negative impact of lifestyle choices on health, fitness and well-being, e.g. the negative effects of smoking (bronchitis, lung cancer). A sedentary lifestyle and its consequences: overweight; overfat; obese; increased risk to long-term health, e.g. depression, coronary heart disease, high blood pressure, diabetes, increased risk of osteoporosis, loss of muscle tone, posture, impact on components of fitness.	 2.2 Use of goal setting and SMART goals to improve and/or optimise performance. P156-163. 2.3 Guidance and feedback on performance. P158-160 2.4 Mental preparation. P161-164
		The nutritional requirements and ratio of nutrients for a balanced diet to maintain a healthy lifestyle and optimise specific performances in physical activity and sport Role of macronutrients: (carbohydrates, proteins and fats) for performers/players in physical activities and sports, carbohydrate loading for endurance athletes, and timing of protein intake for power athletes Role of micronutrients: (vitamins and minerals), water and fibre for performers/players in physical activities and sports. Dietary manipulation for sport (carb-loading, high protein and hydration). Optimum weight due to physical characteristics and variations according to role in physical activity.	Classification of skill - Open–closed, basic (simple)–complex, and low organisation–high organisation continua. Types of practice- massed, distributed, fixed and variable. Application of knowledge of practice and skill classification to select the most relevant practice to develop a range of skills. Goal setting - SMART targets and the value of each principle in improving and/or optimising performance (specific, measureable, achievable, realistic, time-bound). Types of guidance (verbal, visual, mechanical and manual) – advantages and disadvantages of each. Practical links - Appropriateness of types of guidance in a

variety of sporting contexts when used
with performers of different skill levels.
Types of feedback – concurrent,
terminal, internal, intrinsic, extrinsic.
Interpretation and analysis of graphical
representation of data associated with
feedback on performance. Appropriateness
of types in a variety of sporting contexts
when used with performers of different
skill levels.
Mental preparation – warm up and
mental rehearsal.
